1. Use Case Descriptions For Major Use Cases

    a. Use case: *ShowCompany*

        i. Primary actor: User

        ii. Goal: Display a company's page with the link to their timeline on a screen

        iii. Preconditions:

            - User is running the server / is on the web page

            - User is on the home screen

            - Company they are looking for actually exists in the database

        iv. Trigger: user wants to look for a specific company and observe their timeline

        v. Scenario:

            - User clicks "Company List"

            - User can select a company from the list

            - User clicks the "show" button next to the company of their choice.

        vi. Exceptions:

            - Company does not exist: company will not appear on the list

            - User wants to apply a filter as they are searching: user selects the industry the company they are searching for specializes in from a list; the list is then narrowed down

    b. Use case: *AddCompany*

        i. Primary actor: Admin

        ii. Goal: Add a company to the database

        iii. Preconditions:

            - Admin is running the server / is on the web page

            - Admin is on the home screen

- Company they are looking for actually exists in the database (if they're not trying to add one)

    iv.   Trigger: Admin wants to add a company to the database

    v.   Scenario:

- Admin logs in with their username and password

- Admin clicks "Add Company" at the top of the webpage.

- Admin enters all relevant info about the company

- Admin presses "create company"

- Admin then goes to their timeline page and adds relevant entries

    vi.   Exceptions:

- Admin email / pass is incorrect: An error is given asking them to re-enter their credentials as those ones were incorrect

- Admin leaves a field blank: the program tells them to fill in the field when they press "create company" (or "create event" in the timelines table)

c.   Use case: *ApproveSubmission*

    i.   Primary actor: Admin

    ii.   Goal: Add a company to the database via approving a user submission

    iii.   Preconditions:

- Admin is running the server / is on the web page

- Admin is on the home screen

    iv.   Trigger: Admin wants to add a company to the database via approving a user suggestion

    v.   Scenario:

- Admin logs in with their username and password

- Admin clicks "User Suggestions" at the top of the webpage.

- Admin clicks one in the list they find interesting

- Admin reviews the info in the entry

- Admin clicks "add to database"

vi.   Exceptions:

- Admin email / pass is incorrect: An error is given asking them to re-enter their credentials as those ones were incorrect

- Admin is not satisfied with the suggestion: they can either edit it then approve it to the database, or outright delete it
